# Examples : Modular Arithmetic

## Example 1

Perform the following operations (inputs come from  $Z_n$ )

- a. Add 7 to 14 in  $Z_{15}$
- b. Subtract 11 from 7 in  $Z_{13}$
- c. Multiply 11 by 7 in  $Z_{20}$

## Example 2

Perform the following operations (inputs come from  $\mathbb{Z}$  or  $\mathbb{Z}_n$ )

- a. Add 17 to 27 in  $\mathbb{Z}_{14}$
- b. Subtract 43 from 12 in  $\mathbb{Z}_{13}$
- c. Multiply 123 by -10 in  $\mathbb{Z}_{19}$

# Additive Inverse

- In  $\mathbb{Z}_n$ , two numbers  $a$  and  $b$  are additive inverse of each other if
- $a + b \equiv 0 \pmod{n}$
- In  $\mathbb{Z}_n$ , additive inverse of  $a$  can be calculated as  $b = n - a$
- Additive inverse of 4 in  $\mathbb{Z}_{10}$  is 6
- The sum of an integer and its additive inverse is congruent to 0 modulo  $n$ .

- Example Find all additive inverse pairs in  $\mathbb{Z}_{10}$ .

$(0,0)$

$(1,9)$

$(2,8)$

$(3,7)$

$(4,6)$

$(5,5)$

# Multiplicative Inverse

- In  $\mathbb{Z}_n$ , two numbers  $a$  and  $b$  are the multiplicative inverse of each other if
- $a \times b \equiv 1 \pmod{n}$
- The multiplicative inverse of 3 is 7, if the modulus is 10.
- $3 \times 7 \pmod{10} = 1$
- In modular arithmetic, an integer may or may not have a multiplicative inverse. When it does the product of the integer and its multiplicative integer is congruent to 1 modulo  $n$ .

## Example

- (a) Find the multiplicative inverse of 8 in  $Z_{10}$ .
- (b) Find all multiplicative inverses in  $Z_{10}$ .
- (c) Find all multiplicative inverse pairs in  $Z_{11}$ .

(b)  $(1,1)$ ,  $(3,7)$ ,  $(9,9)$

(c)  $(1,1)$ ,  $(2,6)$ ,  $(3,4)$ ,  $(5,9)$ ,  $(7,8)$ ,  $(9,9)$ ,  $(10,10)$

- The integer  $a$  in  $Z_n$  has a multiplicative inverse if and only if  $\gcd(n, a) \equiv 1 \pmod{n}$

Numbers  $a$  and  $b$  are called relatively prime or co-prime if  $\gcd(a, b) = 1$

We know that according to extended Euclidean algorithm,

$$a \times s + b \times t = \gcd(a, b)$$

Let us put  $n$  in place of  $a$ ,  $a$  in place of  $b$

$$n \times s + a \times t = \gcd(n, a)$$

$$(n \times s + a \times t) \bmod n = [\gcd(n,a)] \bmod n$$

$$[(n \times s) \bmod n + (a \times t) \bmod n] \bmod n = [\gcd(n,a)] \bmod n$$

$$[0 + (a \times t) \bmod n] \bmod n = 1 \bmod n = 1$$

$$(a \times t) \bmod n = 1$$

The numbers  $a$  and  $t$  are multiplicative inverse of each other.

$$a^{-1} \bmod n = t, \quad t^{-1} \bmod n = a$$

If  $a$  and  $n$  are co-prime then it is possible to find  $a^{-1} \bmod n$  (multiplicative inverse of  $a$  with respect to  $n$ ) using extended euclidean algorithm.

## Example

Find the multiplicative inverse of 11 in  $Z_{26}$ .

Find the multiplicative inverse of 23 in  $Z_{100}$ .

Find the inverse of 12 in  $Z_{26}$ .

Apply extended Euclidian algorithm

Multiplicative inverse of 23 in  $\mathbb{Z}_{100}$

q	r1	r2	r	t1	t2	t
4	100	23	8	0	1	-4
2	23	8	7	1	-4	19
1	8	7	1	-4	9	-13
7	7	1	0	9	-13	100
	1	0		-13		

$$\begin{aligned} & -13 \bmod 100 \\ & = 87 \end{aligned}$$

23 and 87 are multiplicative inverse.

$$(23 \times 87) \bmod 100 = 2001 \bmod 100 = 1$$

- Find the inverse of 12 in  $Z_{26}$ .

q	r1	r2	r	t1	t2	t
2	26	12	2	0	1	-2
6	12	2	0	1	-2	13
	2	0		-2	13	

$\gcd(26, 12)$  is  $2 \neq 1$ .

Hence, multiplicative inverse of 12 in  $Z_{26}$  is not possible.
