

Image Segmentation

Lecture 3

Thresholding

- Image partitioning into regions directly from their intensity values.
- Consider an image corresponds to dark background and light foreground

a b

FIGURE 10.35
Intensity
histograms that
can be partitioned
(a) by a single
threshold, and
(b) by dual
thresholds.

$$g(x, y) = \begin{cases} 1 & \text{if } f(x, y) > T \\ 0 & \text{if } f(x, y) \leq T \end{cases} \quad g(x, y) = \begin{cases} a & \text{if } f(x, y) > T_2 \\ b & \text{if } T_1 < f(x, y) \leq T_2 \\ c & \text{if } f(x, y) \leq T_1 \end{cases}$$

- **Global thresholding**- The value T is applicable over entire image.
- **Variable thresholding** - T changes over an image
- **Local or regional thresholding** - T depends on properties of neighborhood
- **Dynamic or Adaptive thresholding**- T depends on spatial coordinates themselves.

- The success of intensity thresholding is directly related to the width and depth of the valleys separating the histogram modes.

- Key factor affecting properties of the valleys are

1. Separation between peaks
2. The noise content in the image
3. The relative size of the background and objects .
4. The uniformity of the illumination source.
5. The uniformity of the reflectance properties of the image.

Noise in Thresholding

Noiseless image

b) Intensity Ramp [0.2, 0.6]

$a \times b$

Basic Global Thresholding

Algorithm

1. Select initial threshold estimate for the global threshold T .
2. Segment the image using T
Region $G1$ (values $> T$) and region $G2$ (values $< T$).
3. Compute the average intensities $m1$ and $m2$ of regions $G1$ and $G2$ respectively.
4. Set
$$T = (m1 + m2) / 2$$
5. Repeat steps 2 through 4 until the difference between the values of T in successive iterations is less than ΔT .

Global thresholding:

- The simple algorithm works well where there is a reasonably clear valley in histogram
- ΔT controls the speed of operation \rightarrow number of iteration
- Larger the value \rightarrow less iterations
- Smaller value \rightarrow more iterations
- Initial threshold should be greater than minimum value of image intensity and lesser than maximum value of image intensity
- Avg intensity can be a good choice for initial threshold

Threshold = 125

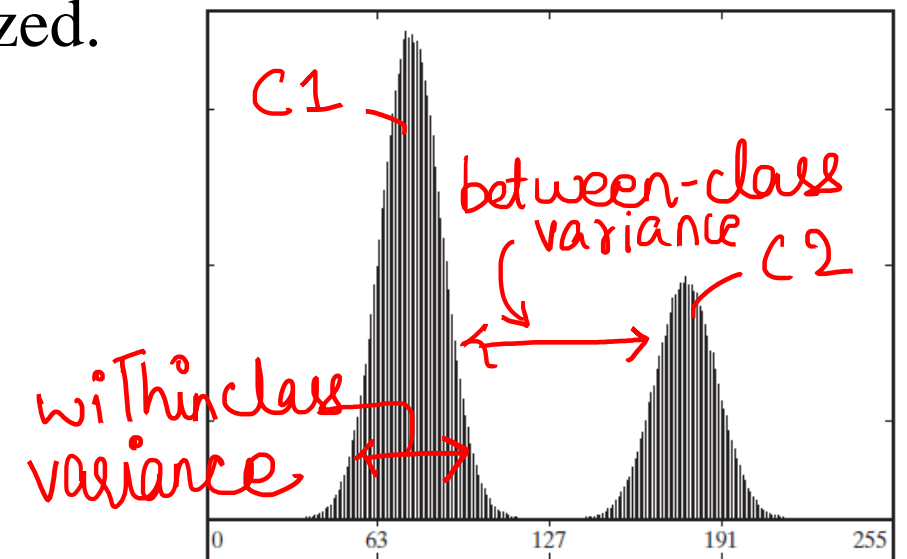

a b c

Otsu's Method

- Optimum Global Thresholding using Otsu's Method.
- Otsu's method is an adaptive thresholding way for binarization in image processing.
- It can find the optimal threshold value of the input image by going through all possible threshold values.(eg. 0 to 255)
- Basic idea is to obtain well separated classes.
- Threshold should be optimum such that *between the class variance* is maximized and *within the class variance* is minimized.

1. Histogram & Probability
2. Mean & Variance
3. within class variance
4. between-class variance
5. Otsu's thresholding

σ_B^2 should be max
 σ_W^2 should be min

Otsu's Method

- Intensity levels: $\{0,1,2,\dots,L-1\}$
- Size of the image: $M \times N$
- n_i : the number of pixels with intensity i
- Total pixels = $MN = n_0 + n_1 + n_2 + \dots + n_{L-1}$
- The normalized histogram has components $p_i = n_i/MN$

$$\sum_{i=0}^{L-1} p_i = 1, \quad p_i \geq 0$$

p_i is probability
of a pixel having
intensity i

- A Threshold $T(k) = k$, $0 < k < L-1$ is selected to threshold the input image into two classes C_1 and C_2 .
- $C_1 \rightarrow$ all the pixels with intensity $[0, k]$
- $C_2 \rightarrow$ all the intensities $[k+1, L-1]$
- $P_1(k)$ and $P_2(k)$ are the probability that pixel is assigned to class C_1 and C_2 respectively or its probability of occurrence of class C_1 and C_2

$$P_1(k) = \sum_{i=0}^k p_i \quad P_2(k) = \sum_{i=k+1}^{L-1} p_i = 1 - P_1(k)$$

k is threshold selected

same as weight in example

- The mean intensity value of the pixels assigned to class C_1 is

$$m_1(k) = \sum_{i=0}^k i P(i/C_1)$$

$P(i/C_1)$ is the probability of intensity i , given that i comes from class C_1

$$P(A/B) = \frac{P(B/A) P(A)}{P(B)}$$

$$= \sum_{i=0}^k i P(C_1/i) P(i)/P(C_1)$$

$$P(C_1/I^0) = 1$$

$$P(i) = P_i \text{ [from histogram]}$$

$$P(C_1) = P_1(k)$$

- Bayes' Formula:

$$= \frac{1}{P_1(k)} \sum_{i=0}^k i p_i$$

$$P(A/B) = P(B/A)P(A)/P(B)$$

Background

Weight $W_b = \frac{8 + 7 + 2}{36} = \underline{0.4722}$

Mean $\mu_b = \frac{(0 \times 8) + (1 \times 7) + (2 \times 2)}{17} = 0.6471$

Variance $\sigma_b^2 = \frac{((0 - 0.6471)^2 \times 8) + ((1 - 0.6471)^2 \times 7) + ((2 - 0.6471)^2 \times 2)}{17}$
 $= \frac{(0.4187 \times 8) + (0.1246 \times 7) + (1.8304 \times 2)}{17}$
 $= 0.4637$

$$\text{mean}_1 = \frac{1}{P_1(K)} \sum_{i=0}^K i P_i$$

$$\leftarrow \frac{1}{0.4722} \left[0 \times \frac{8}{36} + 1 \times \frac{7}{36} + \frac{4}{36} \right]$$

Foreground

Weight $W_f = \frac{6 + 9 + 4}{36} = 0.5278$

Mean $\mu_f = \frac{(3 \times 6) + (4 \times 9) + (5 \times 4)}{19} = 3.8947$

Variance $\sigma_f^2 = \frac{((3 - 3.8947)^2 \times 6) + ((4 - 3.8947)^2 \times 9) + ((5 - 3.8947)^2 \times 4)}{19}$
 $= \frac{(4.8033 \times 6) + (0.0997 \times 9) + (4.8864 \times 4)}{19}$
 $= 0.5152$

- Similarly, the mean intensity value of the pixels assigned to class C_2 is

$$\begin{aligned} m_2(k) &= \sum_{i=k+1}^{L-1} iP(i/C_2) \\ &= \frac{1}{P_2(k)} \sum_{i=k+1}^{L-1} ip_i \end{aligned}$$

- The cumulative mean (average intensity) upto level k is given by

$$m(k) = \sum_{i=0}^k ip_i$$

- The average intensity of the entire image (i.e., the global mean) is given by

$$m_G = \sum_{i=0}^{L-1} ip_i$$

- We can verify the things up till now using the two equations

$$P_1 + P_2 = 1$$

$$P_1 m_1 + P_2 m_2 = m_G$$

$$P_1 m_1 + P_2 m_2$$

$$= P_1(k) \times \frac{1}{P_1(k)} \sum_{i=0}^k ip_i + P_2(k) \times \frac{1}{P_2(k)} \sum_{i=k+1}^{L-1} ip_i$$

$$= \sum_{i=0}^{L-1} ip_i = m_G \text{ (Global mean)}$$

- In order to evaluate the “goodness” of the threshold at level k we use the normalized, dimensionless metric

separability measure $\rightarrow \eta = \frac{\sigma_B^2}{\sigma_G^2}$
 \leftarrow between-class variance
 \leftarrow Global variance

where σ_G^2 is the global variance

$$p_i = \frac{n_i}{MN}$$

$$\sigma_G^2 = \sum_{i=0}^{L-1} (i - m_G)^2 p_i$$

and σ_B^2 is the *between-class variance*, defined as

$$\sigma_B^2 = P_1(m_1 - m_G)^2 + P_2(m_2 - m_G)^2$$

- This previous expression can also be written as

$$\sigma_B^2 = P_1 P_2 (m_1 - m_2)^2$$

$$= \frac{(m_G P_1 - m)^2}{P_1 (1 - P_1)}$$

$$\eta = \frac{\sigma_B^2}{\sigma_G^2}$$

- σ_B^2 and η are measures of separability between classes.
- Larger $\sigma_B^2 \rightarrow$ larger between the class variance \rightarrow more separability \rightarrow higher η
- Generally $\sigma_G^2 > 0$
- If $\sigma_G^2 = 0 \rightarrow$ constant intensity in image \rightarrow only one class possible $\rightarrow \eta = 0 \rightarrow$ indicating no separation between classes.

- Reintroducing k , we have the final results

$$\eta(k) = \frac{\sigma_B^2(k)}{\sigma_G^2}$$

$$\sigma_B^2(k) = \frac{\left[m_G P_1(k) - m(k) \right]^2}{P_1(k) \left[1 - P_1(k) \right]}$$

- Ultimate goal is to find k for which σ_B^2 is maximum

- Then the optimum threshold is the value, k^* , that maximizes $\sigma_B^2(k)$:

$$\sigma_B^2(k^*) = \max_{0 \leq k \leq L-1} \sigma_B^2(k)$$

- In other words, to find k^* , we simply evaluate Eq for all integer values of k , select that value of k that yields maximum $\sigma_B^2(k)$.
- If the maximum exists for more than one value of k , it is customary to average the various values of k for which $\sigma_B^2(k)$ is maximum
- Once k^* has been obtained, the input image $f(x, y)$ is segmented as before:

$$g(x, y) = \begin{cases} 1 & \text{if } f(x, y) > k^* \\ 0 & \text{if } f(x, y) \leq k^* \end{cases}$$

- The normalized metric evaluated at the optimum threshold value, can be used to obtain a quantitative estimate of the separability of classes, which in turn gives an idea of the ease of thresholding a given image.
- This measure has values in the range

$$0 \leq \eta(k^*) \leq 1$$

- Otsu's algorithm may be summarized as follows:
 1. Compute the normalized histogram of the input image. Denote the components of the histogram by p_i , $i = 0, 1, 2, \dots, L-1$.
 2. Compute the cumulative sums, $P_l(k)$ for $k = 0, 1, 2, \dots, L-1$
 3. Compute the cumulative means, $m(k)$, for $k = 0, 1, 2, \dots, L-1$
 4. Compute the global intensity mean, m_G
 5. Compute the between – class variance, $\sigma_B^2(k)$, for $k = 0, 1, 2, \dots, L-1$
 6. Obtain the Otsu threshold, k^* , as the value of for which $\sigma_B^2(k)$ is maximum. If the maximum is not unique, obtain k^* by averaging the values of k corresponding to the various maxima detected.
 7. Obtain the separability measure, η^* at $k = k^*$

$$\sigma_B^2 = \frac{(m_G P_1 - m)^2}{P_1(1 - P_1)}$$

IMP

We know That

$$\rightarrow \sigma_B^2 = P_1(\underline{m_1 - m_G})^2 + P_2(\underline{m_2 - m_G})^2$$

$$\sigma_B^2 = P_1(\underline{m_1^2 - 2m_1m_G + m_G^2}) + P_2(\underline{m_2^2 - 2m_2m_G + m_G^2})$$

$$\sigma_B^2 = P_1m_1^2 - 2(\underline{P_1m_1 + P_2m_2})m_G + (\underline{P_1 + P_2})m_G^2 + P_2m_2^2$$

$$\sigma_B^2 = P_1m_1^2 - 2m_G^2 + m_G^2 + P_2m_2^2$$

$$\sigma_B^2 = P_1m_1^2 - m_G^2 + P_2m_2^2$$

$$\underline{P_1m_1 + P_2m_2 = m_G}$$

$$\underline{P_1 + P_2 = 1}$$

$$\sigma_B^2 = P_1m_1^2 - (P_1^2m_1^2 + 2P_1P_2m_1m_2 + P_2^2m_2^2) + P_2m_2^2$$

$$\sigma_B^2 = P_1(\underline{1 - P_1})m_1^2 - 2P_1P_2m_1m_2 + P_2(\underline{1 - P_2})m_2^2$$

$$\sigma_B^2 = P_1P_2m_1^2 - 2P_1P_2m_1m_2 + P_1P_2m_2^2$$

$$\boxed{\sigma_B^2 = P_1P_2(m_1 - m_2)^2}$$

$$\sigma_B^2 = P_1 P_2 (m_1 - m_2)^2$$

$$m_1 = \frac{1}{P_1(k)} \sum_{i=0}^k i p_i = P_1 P_2 \left(\frac{1}{P_1} \sum_{i=0}^k i p_i - \frac{1}{P_2} \sum_{i=k+1}^{L-1} i p_i \right)^2$$

Cumulative
mean (m)

$$m = \sum_{i=0}^k i p_i \quad m_G = \sum_{i=0}^{L-1} i p_i$$

$$= P_1 P_2 \left(\frac{1}{P_1} m - \frac{1}{P_2} (m_G - m) \right)^2$$

$$= \frac{P_1 P_2}{P_1^2 P_2^2} (P_2 m - P_1 (m_G - m))^2$$

$$= \frac{1}{P_1 P_2} ((1 - P_1) m - P_1 (m_G - m))^2 = \frac{(m_G P_1 - m)^2}{P_1 (1 - P_1)}$$

To prove

$$\sigma_B^2 = \frac{(m_G P_1 - m)^2}{P_1 (1 - P_1)}$$

Multiple Thresholds

- In the case of K classes C_1, C_2, \dots, C_K between the class variance is defined by :

$$\sigma_B^2 = \sum_{k=1}^K P_k (m_k - m_G)^2$$

- Where,

$$P_k = \sum_{i \in C_k} p_i \qquad m_k = \frac{1}{P_k} \sum_{i \in C_k} i p_i$$

- The K classes are separated by $K - 1$ thresholds, whose values $k_1^*, k_2^*, \dots, k_{K-1}^*$ are given by:

$$\sigma_B^2(k_1^*, k_2^*, \dots, k_{K-1}^*) = \max_{0 < k_1 < k_2 < \dots < k_{K-1} < L-1} \sigma_B^2(k_1, k_2, \dots, k_{K-1})$$

- For three classes consisting of three intensity intervals (which are separated by three thresholds) the between-class variance is given by:

$$\sigma_B^2 = P_1(m_1 - m_G)^2 + P_2(m_2 - m_G)^2 + P_3(m_3 - m_G)^2$$

- Where,

$$P_1 = \sum_{i=0}^{k_1} p_i \quad P_2 = \sum_{i=k_1+1}^{k_2} p_i \quad P_3 = \sum_{i=k_2+1}^{L-1} p_i$$

$$m_1 = \frac{1}{P_1} \sum_{i=0}^{k_1} i p_i \quad m_2 = \frac{1}{P_2} \sum_{i=k_1+1}^{k_2} i p_i \quad m_3 = \frac{1}{P_3} \sum_{i=k_2+1}^{L-1} i p_i$$

- Following relationship holds

$$P_1 m_1 + P_2 m_2 + P_3 m_3 = m_G \quad P_1 + P_2 + P_3 = 1$$

$$\sigma_B^2(k_1^*, k_2^*) = \max_{0 < k_1 < k_2 < L-1} \sigma_B^2(k_1, k_2)$$

1. Select the value of k_1
2. Select the value of k_2 such that it is incremented through all possible values which are greater than k_1 but less than $L-1$
3. Compute between-class variance for each pair of k_1 and k_2
4. Increment the value of k_1 repeat the procedure.
5. Select maximum value of between-class variance and corresponding k_1 and k_2 are required thresholds.
6. In case of several maxima, corresponding values of k_1 and k_2 are averaged to obtain final results.

- The thresholded image is then given by

$$g(x, y) = \begin{cases} a & \text{if } f(x, y) \leq k_1^* \\ b & \text{if } k_1^* < f(x, y) \leq k_2^* \\ c & \text{if } f(x, y) > k_2^* \end{cases}$$

- where a , b and c are any three valid intensity values.
- Separability Measure

$$\eta(k_1^*, k_2^*) = \frac{\sigma_B^2(k_1^*, k_2^*)}{\sigma_G^2}$$

a b c
